

ABSTRACT OF THE DISCLOSURE

A laminated modular water filter includes a plurality of superposed support units disposed between top and bottom covers. Each adjacent pair of the top cover, the support units, and the bottom cover define a filter-receiving space for receiving a filter unit therein. Each of the support units is comprised of annular inner and outer supporting members that confine a stirring member therebetween. Each of the stirring members has an inner ring, an outer ring, and a plurality of ribs interconnecting the inner and outer rings.
